3 Model

3.0.1 Question 3

Implement part of the `__init__` function in `Encoder` class and `Decoder` class.

3.0.2 Question 4

Implement the `forward` function in `Encoder` class. This function converts source sentences into word embedding tensors X , generates $h_1^{enc}, h_2^{enc}, \dots, h_m^{enc}$ and computes initial hidden state h_0^{dec} , and initial cell state c_0^{dec} .

3.0.3 Question 5

Implement the `forward` function in `Decoder` class. This function constructs \bar{y}_t and runs the `decode_one_step` function over every time step of the input sentence.

3.0.4 Question 6

Implement `decode_one_step` function in `Decoder` class. This function applies the decoder's LSTM Cell for a single time step, computing the encoding of the target word h_t^{dec} , the attention distribution α_t , attention output a_t and the combined output o_t .

3.0.5 Question 7

Implement `get_attn_weights` function in `Decoder` class. This function will generate attention distribution α_t .
